

ABSTRACT OF THE DISCLOSURE

In order to perform scrub cleaning of a substrate, two different scrub heads 31 and 32 are employed. The scrub head 31 is superior to the scrub head 32 in terms of a capability of removing contamination. The scrub head 32 has a low level of adhesion to the contamination as compared with the scrub head 31. The scrub heads 31 and 32 are moved such that the scrub head 32 follows the scrub head 31. Consequently, it is possible to clean the substrate without re-applying contamination, which has been once removed from a surface of the substrate, to the surface of the substrate again.
